

Requirements Definition Statement:

The requirement definition statement lists all the established functional and nonfunctional requirements of the proposed web application. Functional requirements are processes the system must perform, or data it must contain. Nonfunctional requirements are behavioral properties that the system must have. (E.g. operational, performance, and security).

Functional Requirements:

1. Assets

- ~~1.1 The system will allow users to view availability of assets~~
- ~~1.2 The system will allow users to schedule assets~~
- The system will allow user to view asset properties

2. Configuration Files

- ~~1.1 The system will allow users to view asset configuration files.~~
- ~~2.2 The system will allow users to upload asset configuration files.~~

3. Feedback

- ~~3.1 The system will allow users to submit feedback~~

Login 3.1 System will allow user to login

Nonfunctional Requirements:

1. Operational

- 1.1 The system should be accessible from PCs, and mobile devices.
- 1.2 The system should be compliant with Web Content Accessibility Guidelines (WCAG).

2. Performance

- 2.1 Interaction processing between the user and the system should not exceed two seconds.

3. Security

- ~~3.1 All users must be registered.~~
- 3.2 All users must login to access the main site.
